U.G. 3rd Semester Examination - 2024

MATHEMATICS

[HONOURS]
Course Code: MATH-H-CC-T-07
Numerical Analysis (Theory)
[CBCS]

Full Marks: 40

Time: $2\frac{1}{2}$ Hours

The figures in the right-hand margin indicate marks.

Symbols and notations have their usual meanings.

1. Answer any five questions:

 $2\times5=10$

- a) What do you mean by the degree of precision of a quadrature formula?
- b) When is the Newton's forward interpolation formula used?
- c) State the advantage of Lagrange's interpolation.
- d) Round off the number 78.4625 to four significant digits and compute absolute error and relative error.
- e) State the basic principle of Newton-Raphson method.
- f) Is it possible to find numerically least eigen value for a matrix A by power method? Discuss.

- g) What do you mean by the diagonally dominant for system of linear equations?
- h) Show that $\Delta \log f(x) = \log \left\{ 1 + \frac{\Delta f(x)}{f(x)} \right\}$.
- 2. Answer any **two** questions: $5 \times 2 = 10$
 - a) Discuss the method of iteration for numerical solution of an algebraic and transcendental equation.
 - b) Describe the Gauss-elimination method for numerical solution of a system of linear algebraic equations.
 - c) By integrating Newton's forward interpolation formula, obtain the basic form of Trapezoidal rule for numerical integration, taking the error term.
 - d) Establish Newton's backward interpolation formula. When is this formula used?
- 3. Answer any **two** questions: $10 \times 2 = 20$

(2)

- a) i) Describe power method for finding numerically largest eigen value of a square matrix. State the condition of convergence.
 - ii) Deduce the iterative formula for Picard's method for solving initial value problem.

b) Established Lagrange's polynomial interpolation formula. Using this formula prove that $y_1 = y_3 - 0.3(y_5 - y_{-3}) + 0.2(y_{-3} - y_{-5})$.

for interpolation formula with remainder. Hence deduce Newton's forward difference interpolation formula from this method.

7+3=10

6+4=10

d) Establish Gauss-Jacobi iteration method for numerical solution of a system of *n* linear equations with *n* unknowns. Deduce the condition of convergence for this method.

6+4=10
